2.12 Support Center . . . 6
2.13 Notifications & History . . . 6
2.14 AI Client Assistant . . . 6
2.15 Client Profile & Announcements . . . 6

3 Strict Security & Tenant Isolation Rules **8**

4 Sidebar Routing Codebase Gap **8**

5 Implementation Status Matrix **8**

6 Future Implementation Roadmap **8**

Product Vision Goals

The Client Portal must not feel like a basic dashboard or file-sharing page. It is designed to become the client's primary collaboration space with Dropwing Groups, replacing scattered communication across WhatsApp, email, Google Drive, and other third-party platforms. The portal is clean, premium, transparent, and easy to use while exposing only information that is intended for the client.

Functional Requirements Breakdown & Completion Status

Home Dashboard

Display an executive summary containing the following items:

- Welcome Message
- Account Manager Details
- Active Projects List
- Project Completion Percentage (%)
- Upcoming Meetings Schedule
- Pending Approvals Queue
- Pending Invoices Ledger
- Recent Updates Activity Feed
- Open Support Tickets
- Recent Deliverables Link

Quick Actions UI Components: Raise Requirement, Start Conversation, Join Meeting, View Documents, Raise Support Ticket.

Status: Partially Completed

Missing Implementation: Page renders a basic dashboard frame with static count summaries. The actual cards showing upcoming meetings, recent updates, pending approvals, and account managers are not implemented. None of the Quick Action buttons are connected to actual page routes or API endpoints.

Project Center

Display all projects associated with the client. Each project displays name, status, progress, timeline, milestones, expected delivery date, assigned manager, and recent activity.
Project Detail Sub-Views: Overview, Milestones, Deliverables, Requirements, Timeline, Documents, Approvals.

Status: Partially Completed

Missing Implementation: The main client panel displays a static three-column list of projects. There is no sub-navigation or separate detailed project view; clicking on a project does not load the milestones, requirements, documents, or approvals sub-views.

Live Project Timeline

A chronological activity feed containing events such as: Project Created, Design Submitted, Requirement Approved, Milestone Completed, Meeting Scheduled, Build Released, Invoice Generated, and Payment Received.
Timeline Filters: Today, This Week, This Month, Project Name, Event Type.

Status: Missing

Missing Implementation: No activity logging model exists in the database schema. No timeline feed view has been developed in the client portal frontend.

Requirement Center

Clients can raise new requirements, request modifications, upload supporting files, set priority levels, and track progress status.
Status Flow: Draft → Submitted → Under Review → Approved → In Progress → Testing → Completed → Delivered.
Fields: History log, comments, attachments, linked deliverables, and linked meetings.

Status: Missing

Missing Implementation: No database tables for tracking requirements exist. The frontend has no forms, comment panels, or attachments dropzones for client requirement requests.

Change Request Center

Dedicated scope change module. Each request contains: description, business reason, cost impact, timeline impact, status, and manager comments.
Workflow States: Submitted → Review → Quotation → Approval → Implementation → Completed.

Status: Missing

Missing Implementation: No backend schema or routing logic is set up for scope changes. The client panel lacks any interface for submitting cost/timeline modification requests.

Communication Hub

Primary communication channel featuring real-time chat, file sharing, voice notes, rich text messages, threaded conversations, emoji reactions, read receipts, search messages, and pinned messages.
Dedicated Channels: General, Requirements, Design Review, Billing, Support, and Announcements.

Status: Missing

Missing Implementation: Although a standard employee-to-employee chat page exists, client session integration for dedicated venture communication channels is completely absent. No voice notes, threads, or channel categories have been created.

InternalX Meetings

Native meeting framework (no external links allowed). Features: Video Calls, Audio Calls, Screen Sharing, Meeting Chat, File Sharing, Recording, and Attendance.
Post-Meeting Auto Summaries: Recording, Transcript, Summary, Action Items, Next Steps.

Status: Missing

Missing Implementation: There is no audio/video conference capability (WebRTC) built in. The frontend client dashboard has no calendar integrations or meeting wrap-up cards.

Deliverables Center

Dedicated list for completed work packages (UI Designs, Source Code Packages, APK Files, Build Links, Deployment URLs, Reports, User Manuals, Training Videos).
Status Flow: Draft → Submitted → Approved → Rejected → Revision Requested → Completed.

Status: Partially Completed

Missing Implementation: Deliverables are shown as a read-only list within the client portal layout. Interactive options for the client to approve, reject, or request revisions are missing. Version uploading and comment histories are not implemented.

Documents Vault

Organized folder repository supporting Contracts, NDAs, Proposals, Quotations, Invoices, Reports, Deliverables, and Manuals.
File Features: Preview, Download, Version History, Search, Categories.

Status: Partially Completed

Missing Implementation: Shared files are retrieved from the database and displayed in a grid with custom file type icons. However, double-clicking or clicking the download button does not trigger a file transfer. Client file uploading and folder organization are not implemented.

Approval Center

Client sign-off system for UI Designs, Requirements, Quotations, Milestones, Deliverables, and Deployments.
Actions & Metadata: Approve, Reject, Request Changes (stores user details, timestamp, and comments).

Status: Missing

Missing Implementation: No approval database table or client action buttons are implemented in the UI.

Financial Center

Client-visible financial details only: Invoices, Payment History, Outstanding Amount, Upcoming Payments, and Quotations. Features include Invoice Download, Receipt Download, and Payment Status Tracking.

Status: Partially Completed

Missing Implementation: The system aggregates timesheet hours on the fly to simulate monthly billings at a hardcoded $50/hr rate. There is no physical ‘invoices‘ table or payment ledger. Payment gateway checkouts (Razorpay) are not integrated.

Support Center

Helpdesk module where clients can Raise Tickets, Track Progress, Upload Screenshots/Videos, and Reply to Support Team.
Status Flow: Open → Assigned → In Progress → Waiting for Client → Resolved → Closed.
Priority Levels: Low, Medium, High, Critical.

Status: Missing

Missing Implementation: No ticketing models or routes exist in the backend. The frontend portal lacks any ticket submit forms or thread panels.

Notifications & History

- **Notifications Center:** Real-time push alerts for requirements, meetings, approvals, deliverables, invoices, and ticket updates.
- **Activity History:** Complete client-visible audit trail displaying timestamped events.

Status: Missing

Missing Implementation: The application does not contain a persistent audit logging schema, and real-time push notification sockets have not been configured for Level 9 users.

AI Client Assistant

Embedded chatbot scoped only to the client’s own data. Capabilities include summarizing progress, explaining status, finding documents/invoices, summarizing meetings, and answering requirement questions.

Status: Missing

Missing Implementation: No chatbot drawer exists in the frontend. There is no backend vector index, document parser, or LLM interface for client query isolation.

Client Profile & Announcements

- **Client Profile:** Company details, contacts, PM name, timezone, and communication preferences.
- **Announcements:** Banner displays for Product Updates, Maintenance Notices, Release Notes, and holiday schedules.

Status: Missing

Missing Implementation: The Profile tab is completely static and unpopulated. There is no announcements database table or marquee notification system on the dashboard banner.

Strict Security & Tenant Isolation Rules

CRITICAL SECURITY POLICY

Clients must **NEVER** see or have access to any of the following internal operations:

- Internal Developer Notes & Private Communications
- Internal Team Discussions & Resource Allocation
- Employee Performance Ratings
- Venture Profit Margins & Internal Financial Analysis
- Internal Venture Risks & Management Strategy
- Management Comments not explicitly shared with the Client
- Cross-client or Cross-tenant Information of other ventures

To enforce this security policy, the backend implements server-side role-based access controls (RBAC) and strict database tenant isolation. Every database query returning client-facing data must be dynamically isolated using the venture identifier verified against the client session:

$$\text{SQL Security Policy: } \sigma_{\text{venture_id}=\text{session_venture_id}}(\text{Entity}) \tag{1}$$

Any attempt to query data without a matching `venture_id` check or requesting administrative tables will result in an immediate authorization failure.

Sidebar Routing Codebase Gap

In the dashboard root controller (`frontend/src/app/dashboard/page.tsx`), the routing condition for employees intercepts client page loads. When a Client clicks **Project Status** or **Deliverables**, they are shown the employee-facing Strategic Kanban board.

Routing Bug Snippet

```
// page.tsx (Intercepts Client Route)
) : ['Projects', 'My Projects', 'Project Status', 'Deliverables']
    .includes(menus[activeMenu]) ? (
  <ProjectsView currentUser={user} />
```

Implementation Status Matrix

Future Implementation Roadmap

- **Phase 1 (Immediate):** Resolve the routing interception check in `page.tsx` and connect the document download links in the documents grid.
- **Phase 2 (Short-Term):** Create schemas for `requirements`, `deliverables`, and build the Client-Venture chat channel system.
- **Phase 3 (Medium-Term):** Integrate Razorpay API webhooks, build the Support ticketing console, and add meetings calendar scheduling.

Feature Group	Status	Identified Gap
Home Dashboard	**Incomplete**	Only displays static count metrics; lacks Quick Actions.
Project Center	**Incomplete**	Read-only list; missing detail views and sub-tabs.
Live Project Timeline	**Missing**	No chronological activity feed backend or frontend.
Requirement Center	**Missing**	No schema, creation forms, or workflow controls.
Communication Hub	**Missing**	Chat page exists, but is not configured with client venture channels. WebRTC meetings are absent.
Deliverables Center	**Incomplete**	Read-only task list; missing action approvals.
Documents Vault	**Incomplete**	Files list is static; no download handler.
Financial Center	**Incomplete**	Dynamically derived timesheets; no invoices table or Razorpay checkouts.
Support Center	**Missing**	No helpdesk ticketing backend or frontend.
AI Client Assistant	**Missing**	No RAG query pipeline or client isolation boundaries.
